Personal Introduction

I am a Business Analyst at Podium Analytics with a First-Class Master's (MEng) in Biomedical Engineering from Imperial College London where my dissertation focused on privacy attacks against synthetic medical data. I also build AI applications from ideation to production, most recently Lab2Launch – a Claude powered investor readiness tool for tech-founders and researchers. Working across both technical and commercial sides of building products has taught me to move between and deeply understand all domains and translate that technical depth into language that drives decisions. Outside of work I'm training for an Ironman 70.3 and enjoy producing music.

Experience

Podium Analytics

Business Analyst - June 2025 – Present

- Independently developed a GTM strategy to redefine our market positioning to include B2C, grounded in competitor analysis and market research insights, and then presented findings to C-suite stakeholders
- Collaborated with external partners, leading cross-functional stakeholder workshops on all major projects and ensuring alignment on project outcomes
- Delivered user-focused solutions by product roadmap prioritisation, informed by user feedback and market research, aimed at improving the user experience
- Analysed and formalised the project initiation process at enterprise level using swim lane and actor-task diagrams, driving company-wide adoption
- Proactively undertook BA responsibilities alongside my QA Analyst role, seeking greater impact whilst delivering process improvements and cost savings
- Built Jira and Confluence environments from scratch to improve workflows and increase collaboration through a multi-partner framework

QA Analyst - September 2024 – September 2025

- Improved regression testing coverage by 200%, reducing issues raised by 90% over 3 months
- Directed and documented the first end-to-end RFP process for Automated Testing partners, from expert consultation to PoCs, driving the final decision
- Improved successful QA analyst onboarding speed by 300% by creating the first guidelines for the role, whilst setting and reaching key deliverables for team KPIs
- Improved defect logging quality, enabling faster resolution and reducing developer back-and-forth

Education

Imperial College London

Biomedical Engineering MEng – 1st Class Degree

Relevant Modules: Medical Device Entrepreneurship, Leading Teams and Organisations, Programming, Statistics, Computational Neuroscience, Brain Machine Interfaces, Biomedical Imaging, Biosignal Processing, Image Processing.

Projects

Imperial College London

Success of Membership Inference Attacks (MIAs) against Synthetic ECG Data

- Pioneered the first MIA method for time-series medical data by adapting a tabular MIA method, addressing a critical gap in synthetic data privacy research
- Evaluated privacy risks: generative models could leak patient information with up to 91% accuracy, displaying the key adoption 'trust' barrier for AI in healthcare
- Consulted lawyers and research directors on the ethics and risks of empowering attackers against the benefits of enabling synthetic data providers to implement defences, demonstrating responsible innovation
- Developed defensive solutions to reduce MIA accuracy to baseline (50%) through hyperparameter optimisation to reduce overfitting, enabling safer sharing of synthetic ECG data, allowing for improved medical diagnoses
- Identified and proposed improved MIA methods to address initial method shortcomings, showing potential research directions to improve future protection
- Documented the methodology for reproducibility, publishing the full codebase to encourage further improvements in this area

Personal

Lab2Launch – Investor Readiness Analyser for Founders

- Rapidly prototyped and shipped an AI tool aimed at helping tech-founders and researchers raise investment, outputting an investor friendly summary, gap analysis, and prioritised actions
- Implemented a two-pass agentic LLM workflow on the Claude API: initial inputs trigger adaptive follow-up questions to improve accuracy and ground the final analysis
- Architected a multi-agent planner-executor workflow in Claude Code, where an orchestrating agent pulls features and delegates tasks across specialised sub-agents, demonstrating practical agentic system design
- Embedded strategic BA frameworks (POPIT, SWOT etc.) within the prompt architecture ensuring Claude applies a methodology and not free-reasoning, producing consistent outputs across runs

Personal Information

Skills

AI/LLM: Claude API, Prompt Engineering, Agentic Systems, Multi-agent workflows (Claude code), Claude Agent Skills, Frontier LLMs, Machine Learning, Privacy-preserving ML, Synthetic Data Generation, Privacy Evaluation

Languages: Python (Pandas, Numpy, Scikit-Learn, Matplotlib), Modern IDE's and Integrations, MATLAB, CSS, HTML, SQL

Business Analysis and Delivery: Strategic Frameworks (POIT, SWOT, PESTLE), Stakeholder Management, Requirements Analysis, Documentation, and Management, Jira, Confluence, Technical PRD Writing, User Research

Other: AstroJS, Signal Processing, Statistical Evaluation, GitHub, Final Cut Pro, Logic Pro, Pixelmator Pro, Microsoft Office

Interests

Applied AI, Health-tech, Medical Device Entrepreneurship, Machine Learning, Healthcare Research, Longevity Science, Travel, Formula 1, Swimming, Photography, Music, Graphic Design

Achievements

- Achieved 98% in Business Analyst BCS Foundation Exam
- Competitive National-level swimmer – 15 hours training per week over 15 years, building organisation skills and resilience
- Swimming Captain at Wellington College, leading my team to 8th and 9th at a National Competition

Eddy – App for Anxious Swimmers (swimwitheddy.com)

- Founded a business targeting anxious swimmers, beginners, and triathletes, validating the problem through user research before building
- Defined and prioritised core MVP features to align with user needs whilst managing execution efficiently as a solo founder
- Ideated the brand identity, tone of voice, and visual design direction with custom assets
- Developed a site with the Astro.js static rendering framework for SEO optimisation and implemented Umami Analytics to track user behaviour
- Built a pre-launch onboarding and data capture system (Tally and Zapier) to gather user details, inform product design, and seed an early user base
